

Spaces which remember themselves.

Where does the space we created in our own time end?

Is it possible to cristalize the created space in a definite time? What are the relations between water end memory?

I like the idea of a transforming material in different states ond different dimensions. Transitions of stable conditions of memories to a constitution of dynamic memory. The forms in the ice found a condition of stable memory.

We are now reoding an introduction to my work, in a few moments it will belong to your memory.

My interest concern the limit-possibility, at the end of this writing, to avoke the space in which, in this moment, you are living.

The space becomes a dimension which is not only including time-memory relations. This created dimension: realm, where it is possible to extend your own existence: a concrete opening possibility to the real. The form in ice evokes the moment space of

The object, timely becoming, represents the opening which, in its own opeering transform itsself in the real of existence: etern.

Water, ice, steam, ore dynamically equilibrated.

The transformotion process concerns a condition: the becoming in its own dynamicity ond time, it develops in a space, which opens a realm. This realm, reason to exist, or to exist forever; it has its own developed time in the memory of reoalm: the indistinct possibility to remember a certain event space, independently from the experience of our subjective memory.
